

LinkedIn Content Curator – End User Guide Overview

An introduction to requesting, approving, and publishing LinkedIn thought leadership posts

LinkedIn Content Curator Guide Overview

Purpose and Scope of the End User Guide

Guide Purpose and Audience

Helps the approver, Stephen Caruana, and the notified reviewers request, review, and publish LinkedIn thought leadership posts on the contingent workforce industry.

Governed, Human-in-the-Loop Publishing

Explains the two approval gates that stand between AI-curated content and a live LinkedIn post, so nothing publishes without an explicit decision.

One Platform, Many Channels

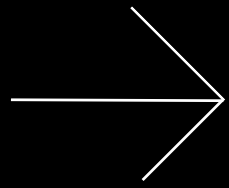

Covers every place you can act: the Start a Run and Content Approvals apps, Microsoft Teams, Outlook email, Copilot agent chat, and the Power BI dashboard.

Day-to-Day Operational Reference

Use it as a playbook for starting runs, making gate decisions, checking drafts, reading metrics, and responding to alerts.

Introduction to the Platform

Platform Components and How They Work Together

Power Apps: Your Front Door

Start a Run collects your curation request. The LinkedIn Content Approvals app shows every run, records gate decisions, and hosts the metrics dashboard.

Copilot Studio: The News Curator Agent

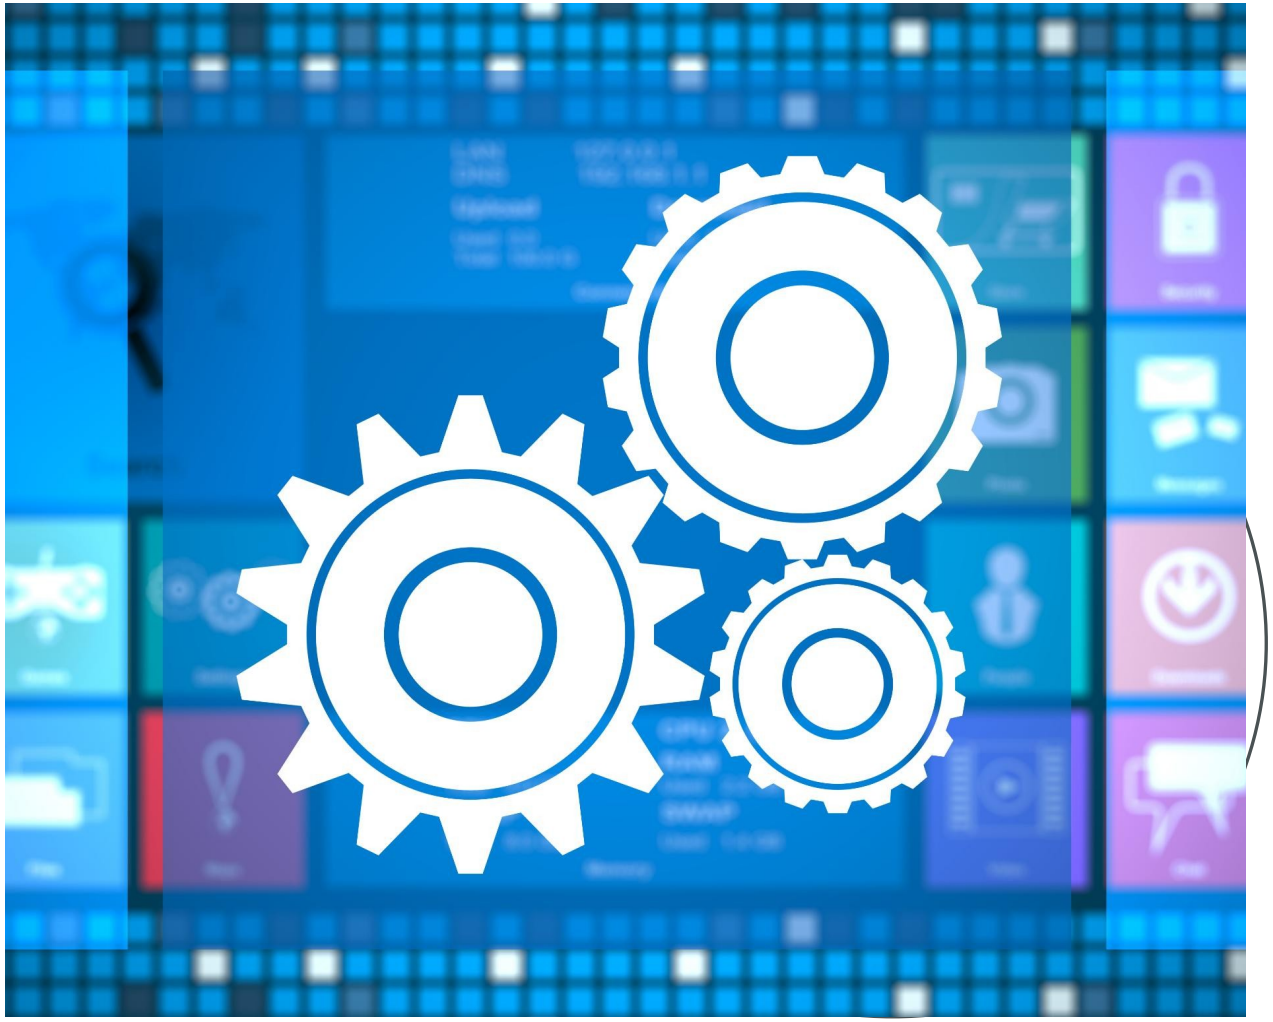

Finds 1–3 credible, recent industry articles and drafts the post in Stephen’s voice. It never invents articles to fill a quota.

Power Automate: The Orchestrator

Runs the weekly schedule, validates articles, routes Gate 1 and Gate 2, publishes to LinkedIn, and sends alerts and confirmations.

SharePoint and Power BI: Records and Metrics

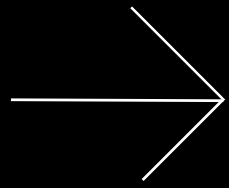

Two SharePoint lists hold the status and audit trail of every run. Power BI turns them into dashboard metrics that refresh daily.

What Each Tool Does for You

Tool	What you do there	When to use it
Start a Run (Power Apps)	Choose industry, topics, audience, management style, recency, and audited sources, then click Start run	Off-cycle or custom runs
Content Approvals (Power Apps)	Review each run and record Gate 1 and Gate 2 decisions; open the Dashboard tab	Main place to decide and track
Microsoft Teams	Act on Gate 1 and Gate 2 cards; receive alerts and confirmations	When you are working in Teams
Outlook email	Read the full content; buttons open the approvals app on that run	Backup channel and awareness copies
Copilot agent chat	Start a run, review options, and decide with chat buttons	When you prefer a conversation
Power BI dashboard	See run and publishing metrics; refresh on demand	Weekly review, or any time

Roles and Support Contacts

Who Does What and Who to Contact

Approver: Stephen Caruana

The single approver. Only Stephen selects the article at Gate 1 and authorizes publishing at Gate 2.

Notified Reviewers

A small distribution list of the approver, the workflow administrator, and a designated reviewer receives every gate email, alert, and confirmation.

Recording a Decision

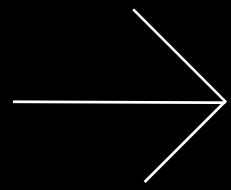

Decisions are recorded only by someone signed in to the Microsoft 365 tenant, through the app, Teams, or agent chat. Other recipients are copied for awareness.

Workflow Support

For failed runs, stuck statuses, or duplicate notifications, contact the workflow administrator and include the Request ID.

How a Run Works

End-to-End Run Lifecycle

Start

A run starts every Wednesday at 8:10 AM Eastern, or on demand from Start a Run or agent chat. Each run gets a unique Request ID.

Curate and Validate

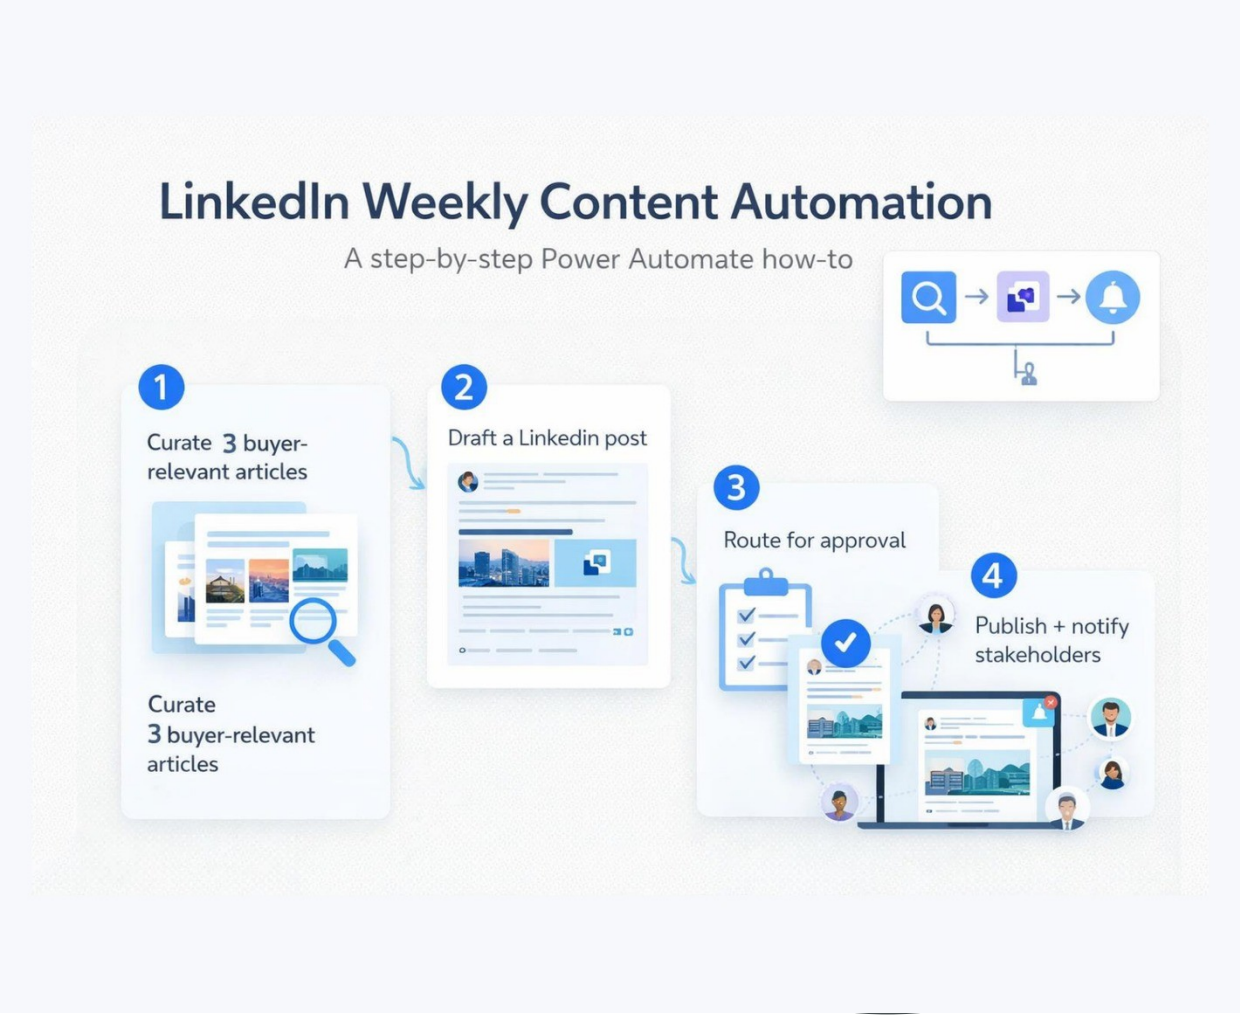

The agent returns 1–3 articles. The flow drops any article outside the current or prior month, or missing a title, publisher, summary, or HTTPS link.

Approve Twice

Gate 1 picks the article. The agent drafts a 150–250 word post. Gate 2 approves the final text before anything goes public.

Publish, Confirm, and Log

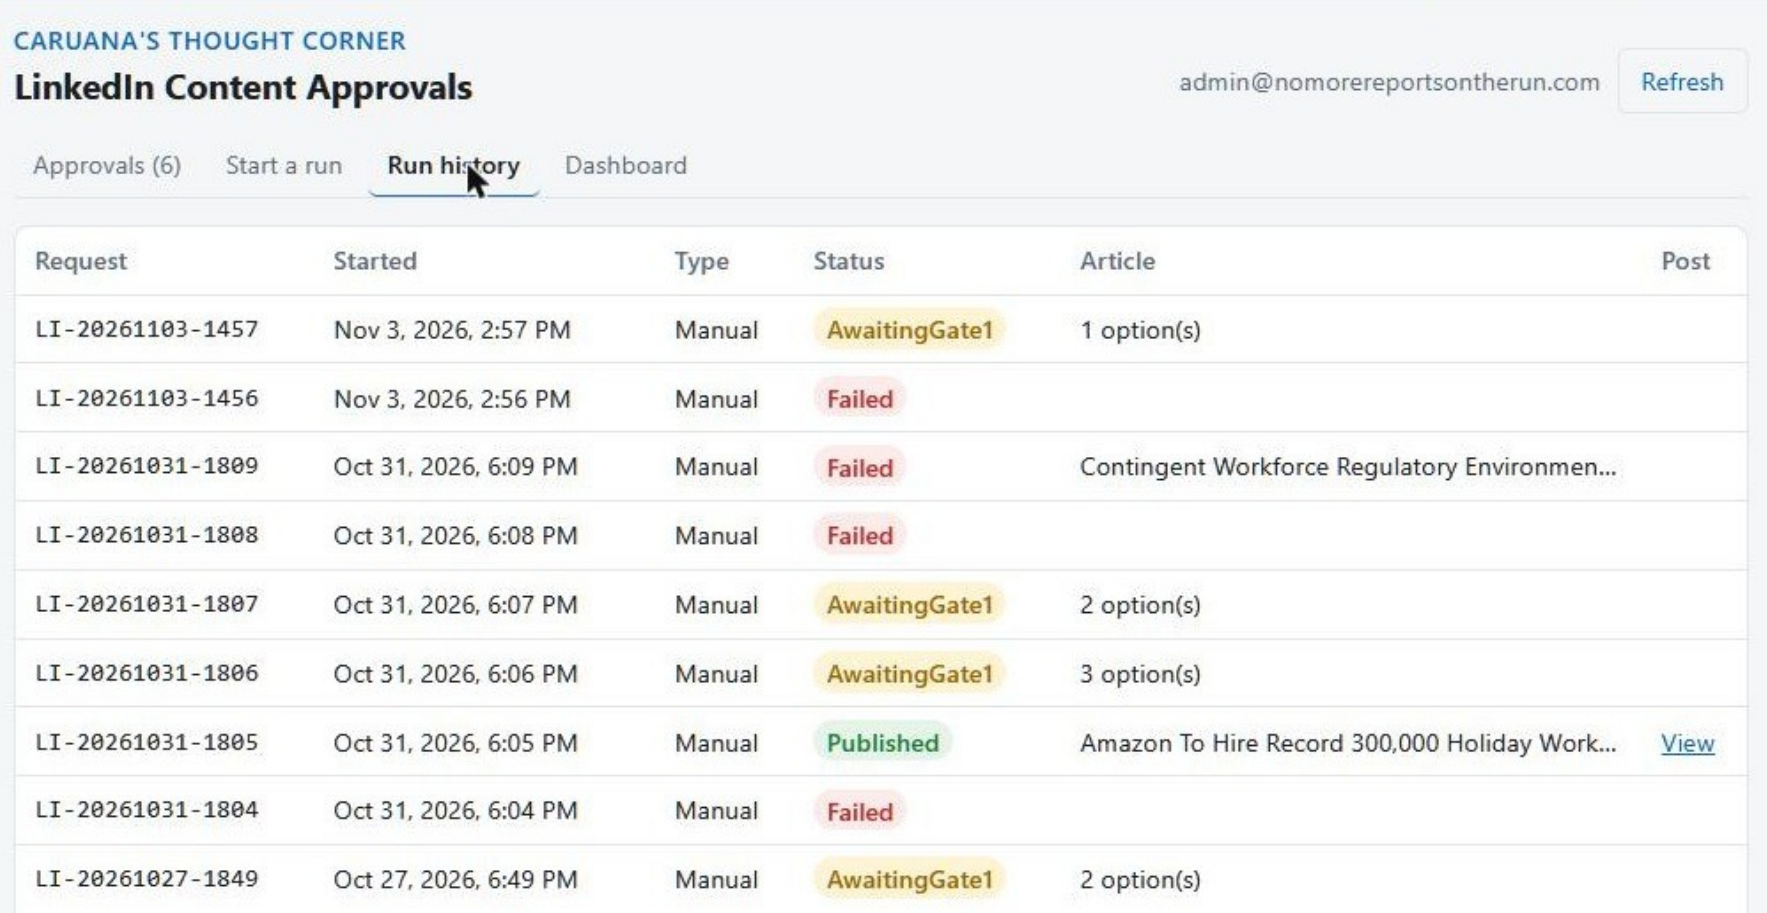

The approved post goes live on LinkedIn, a confirmation with the post link is sent, and every step is logged in SharePoint.

Run Status Reference

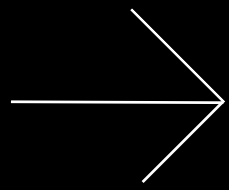

Status	What it means	Who acts next
Curating	The agent is finding and validating articles	System
AwaitingGate1	Article options are ready for your choice	Approver
SentBack	You asked for new articles; curation restarts with your comments	System
Drafting / Revising	The agent is writing or revising the post	System
AwaitingGate2	The draft is ready for publish approval	Approver
Publishing	The approved post is being sent to LinkedIn	System
Published	The post is live and a confirmation was sent	No action
Rejected / Failed	Stopped by your decision, or by an error with an alert	Review the alert if Failed

Tracking Runs in Run History

The Run history tab in the LinkedIn Content Approvals app lists every run with its Request ID, start time, type, status, and article. Published runs include a View link to the live LinkedIn post.

Start a Run

Requesting a New Curation Run

Open Start a Run

Launch the LinkedIn Start a Run app (titled Start a curation run). If it asks for access to your data, click Allow so it can load its menus from SharePoint.

Fill In the Required Fields

Fields marked * are required: Topics, Audience, Management Style, Recency (months), and Audited sources only. Pick Industry first so Topics lists only that industry's topics.

Add Optional Guidance

Name a Publisher/Account if you want one, and type Special Instructions in the notes box, for example "Focus on new state contractor laws."

Click Start Run Once

A green "Run requested" banner confirms it. Gate 1 lands in the approval app, Teams, and email when the agent finishes curating.

The Start a Run Screen

The live Start a Run app. Audience defaults to Buyers / Client-Side Decision Makers, Management Style to Strategic, and Recency to 1 month. Start run stays disabled until a topic is chosen.

Start a Run Fields at a Glance

Field	What to enter	Default
Industry	The industry to search; it filters the Topics list	None
Topics *	The subject of the article, for example SOW governance or AI in recruiting	None (required)
Audience *	Who the post is for: Buyers, Procurement, MSP, VMS, HR / Talent, or Suppliers	Buyers / Client-Side Decision Makers
Management Style *	The angle of the post: Strategic, Operational, Tactical, Executive, or Educational	Strategic
Recency (months) *	How far back articles may be published	1
Audited sources only *	Choose Yes to keep the search to trusted, audited publishers	None (required)
Publisher/Account	Optional preferred source, for example Staffing Industry Analysts	Blank
Special Instructions	Optional notes passed straight to the agent	Blank

Scheduled and Manual Runs

Weekly Scheduled Run

Runs automatically every Wednesday at 8:10 AM Eastern with RunType set to Scheduled. No action is needed until Gate 1 arrives.

Manual Off-Cycle Run

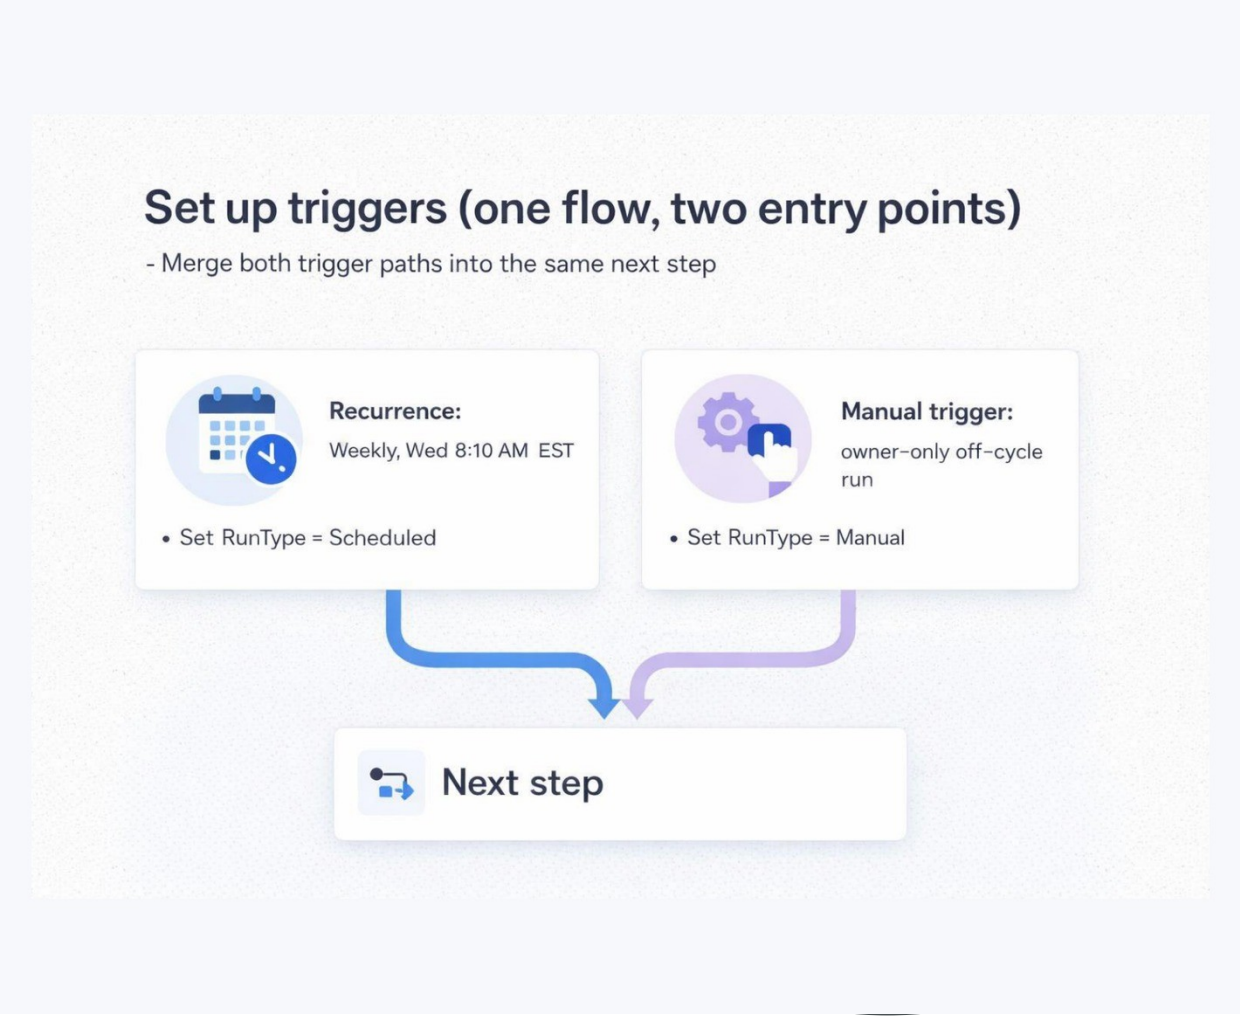

Start a run any time from Start a Run or agent chat. It is tagged RunType Manual and follows exactly the same controls.

Recency Rule

Articles must fall inside the Recency (months) window you set. The default of 1 means this month or last month.

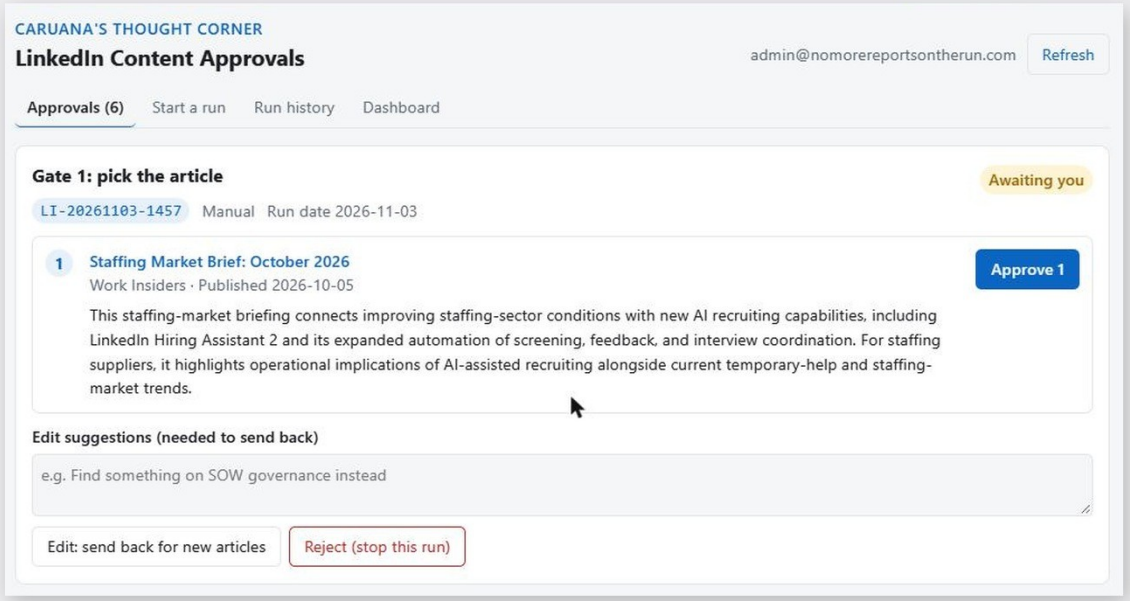

Avoid Duplicate Runs

Click Start run once and wait for the confirmation. Each click creates a separate run with its own notifications.

Approval Gate 1: Article Selection

Choosing an Article at Gate 1 in the App

Approvals Tab

Every run waiting on you appears as a card marked Awaiting you, with its Request ID, run type, and run date. The tab shows how many are waiting.

Approve the Article You Want

Each article shows its linked title, publisher, published date, and summary. Click its Approve button to send it to drafting.

Send Back for New Articles

Type in Edit suggestions, for example “Find something on SOW governance instead,” then click Edit: send back for new articles.

Reject (Stop This Run)

Ends the run immediately. Nothing is drafted or published, and the run is marked Rejected.

Gate 1 Decisions in Every Channel

Channel	How you decide	Good to know
Content Approvals app	Open the run and choose Approve 1, 2, or 3, Send back, or Reject	Primary record of the decision
Teams card	Click Approve 1, 2, or 3, Send back for new articles, or Reject (stop this run)	Comments are required for Send back
Email (backup)	Buttons open the approvals app on that run with your choice preselected	Confirm in the app to record it
Copilot agent chat	Click approve 1, approve 2, approve 3, send back with comments, or reject	Reject ends the run

The Gate 1 Email Notification

Subject and Recipients

Contingent Workforce Article Options for Review goes to the approver and the two notified reviewers as soon as curation passes validation.

Every Article in Full

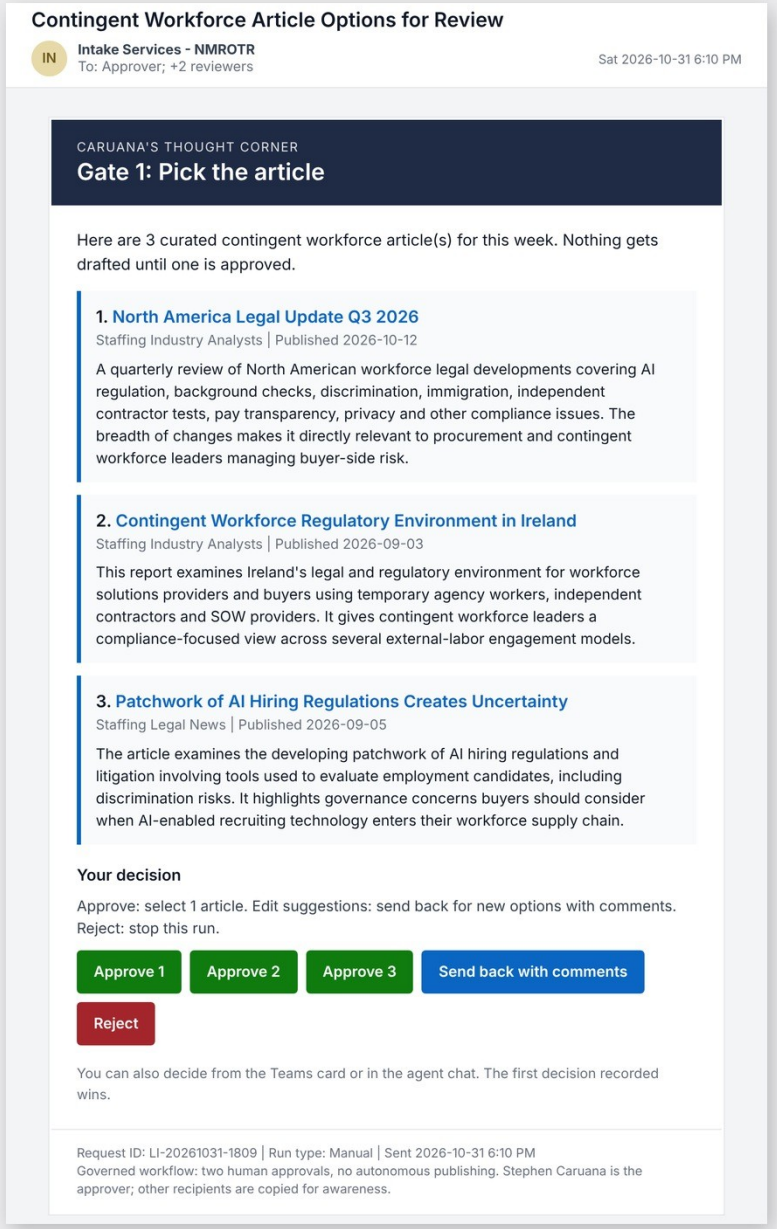

Each option shows its title as a link, the publisher, the published date, and a short summary, so you can decide from your inbox.

Decision Buttons

Approve 1, 2, or 3, Send back with comments, and Reject open the approvals app on that run with your choice ready to confirm.

First Decision Wins

You can also decide in Teams or agent chat. Whichever decision is recorded first is the one the run follows.

Approving from Copilot Agent Chat

Start in Chat

Ask the News Curator agent to start a run. It uses the same parameters as the app and creates a run with a Request ID.

Same Content as the Email

The chat response lists the same 1–3 articles with title, summary, published date, and a link to each.

Action Buttons

Choose approve 1, approve 2, approve 3, send back for new articles with comments, or reject. Reject terminates the run.

Draft Format in Chat

The draft appears as REQUEST ID, LINKEDIN POST, Source: URL, and the footers, ready for the Gate 2 decision.

Approval Gate 2: Publish Approval

Reviewing and Approving the Post Draft

What You Receive

The full draft, the hyperlinked source article, the draft version, and the body word count, in the app, the Teams card, and email.

Make Light Edits Before Approving

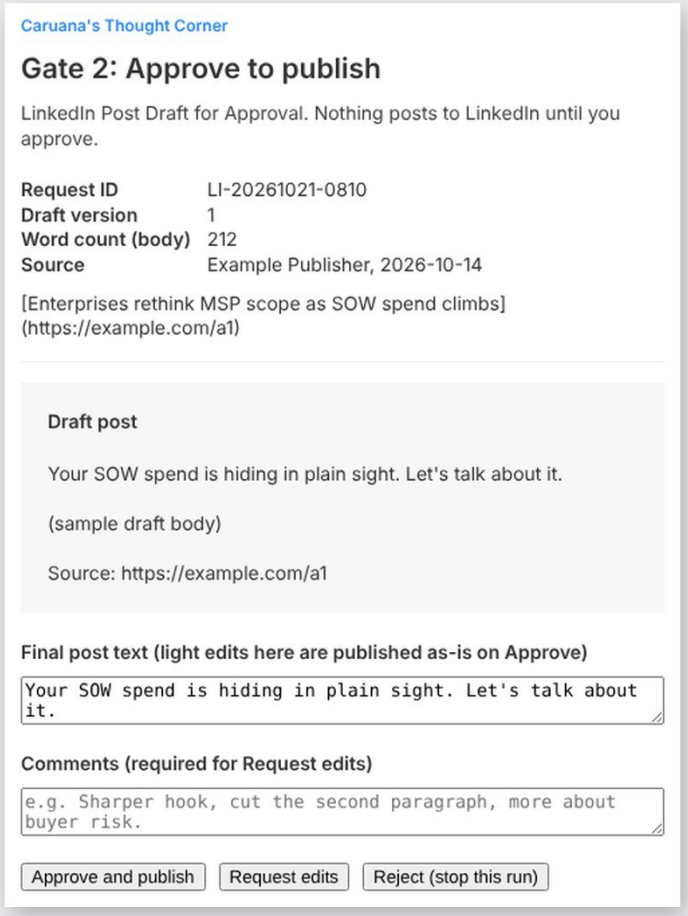

On the Teams card, edit the Final post text box. Whatever is in that box when you approve is exactly what gets published.

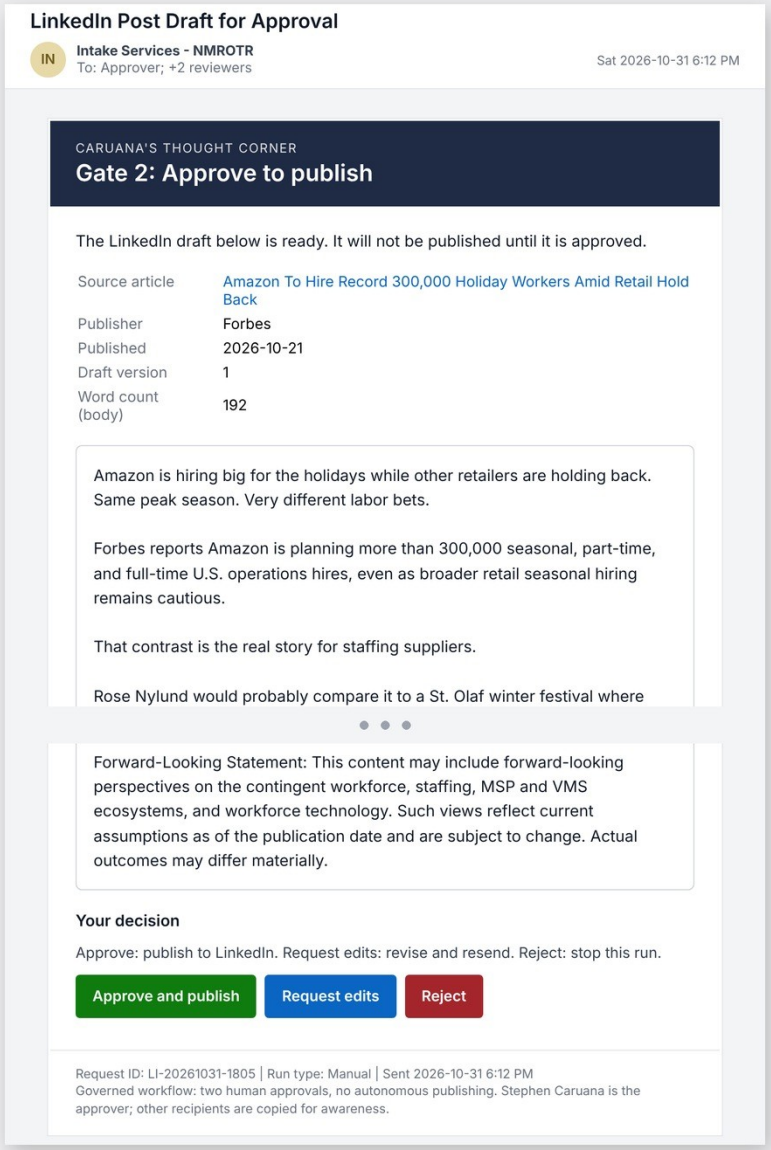

Request Edits or Reject

Request edits sends your required comments to the agent for a new version. Reject stops the run with nothing posted.

Approve and Publish Is Live

Approval publishes immediately to linkedin.com/in/scaruana22. There is no dry run, so read every word before you click.

The Gate 2 Email Notification

Subject and Summary

LinkedIn Post Draft for Approval shows the source article, publisher, published date, draft version, and body word count.

The Full Draft

The complete post appears exactly as it will publish, including the Source link, the disclaimer, and the Forward-Looking Statement.

Decision Buttons

Approve and publish, Request edits, and Reject open the approvals app on that run so you can confirm the decision.

Approve Means Live

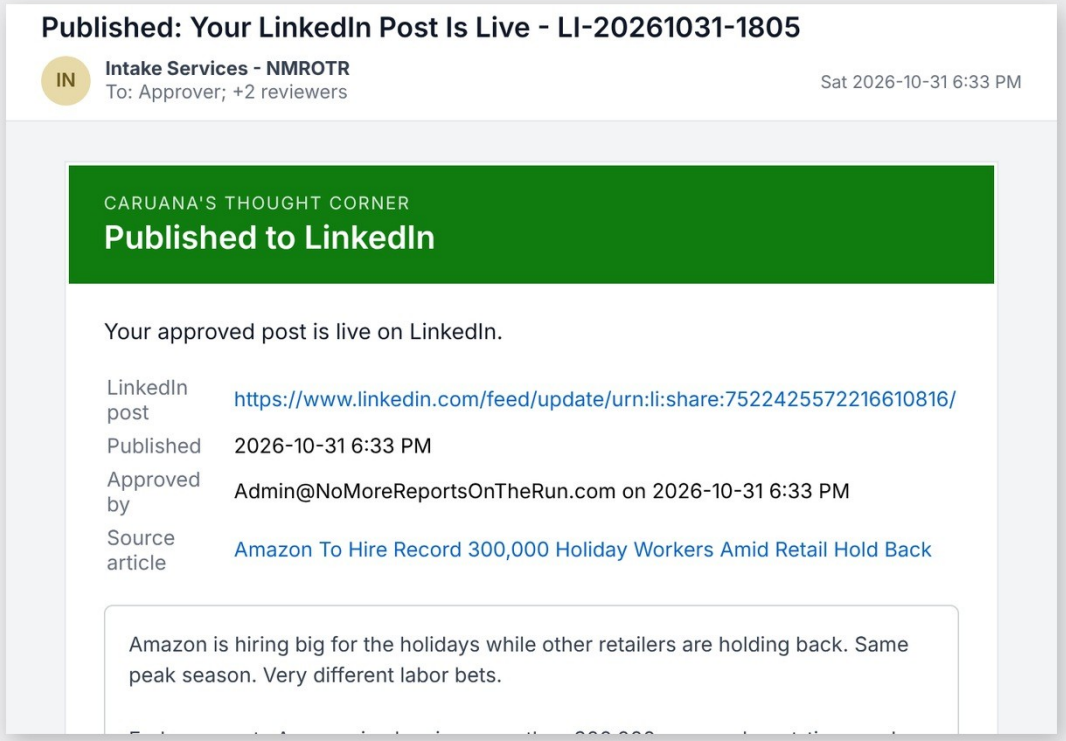

Approve and publish posts to LinkedIn right away. Read the whole draft in the email or app before you confirm.

Draft Review Checklist

Check	What good looks like
Source	Uses only the approved article; no unrelated claims or other articles
Length	150–250 words in the body, and under LinkedIn's 3,000-character limit
Structure	A hook that earns "Read more," the key takeaway, strategic perspective, and buyer implications
Voice and tone	Stephen's voice: confident, direct, quick-witted, executive, and non-promotional
Language	US English spelling and grammar
Source link	Ends with "Source:" followed by the article's full https:// link
Footers	The GenAI disclaimer and the Forward-Looking Statement are both present

Publishing and Confirmation

After You Approve: Publishing and Confirmation

Live Publishing

The flow posts your approved final text, with its source link, to Stephen's LinkedIn account through the LinkedIn connection.

Confirmation Message

One confirmation arrives by email and Teams with the LinkedIn post link and the publish timestamp.

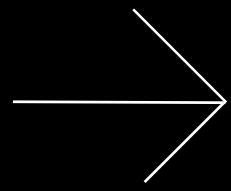

Audit Record Updated

The run moves to Published, and SharePoint stores the final text, approver, timestamps, and LinkedIn URL.

If Publishing Fails

The run is marked Failed and an alert names the step and error. Check LinkedIn before re-running to avoid a double post.

Dashboard and Metrics

Using the Metrics Dashboard

Where to Find It

Open the Dashboard tab in the Content Approvals app. Tiles show runs, published, waiting on you, success rate, gate approval rates, failures, and post length.

Live Tiles and Charts

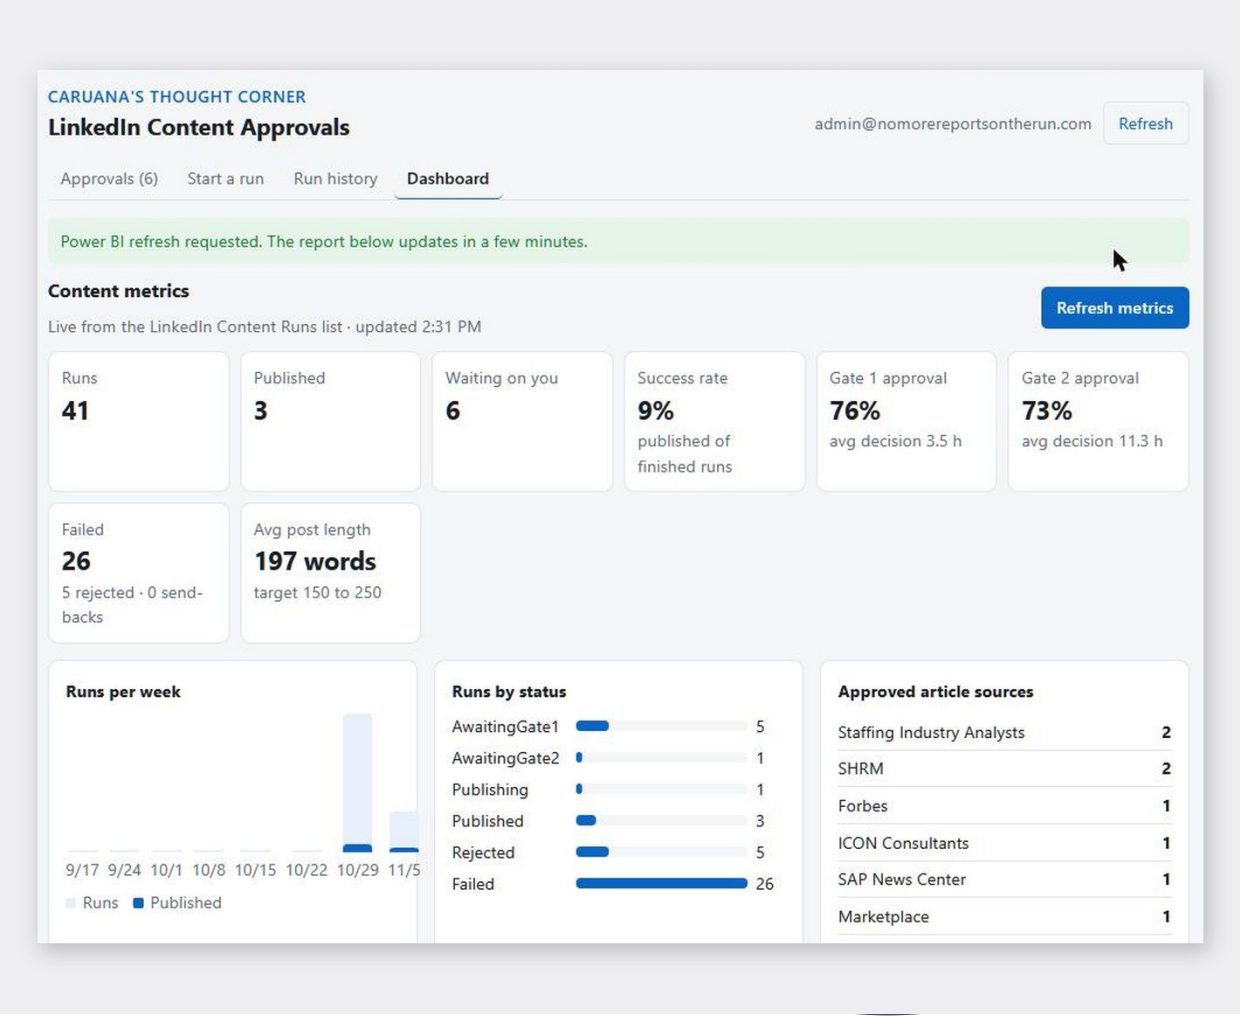

Tiles read live from the LinkedIn Content Runs list. Charts show runs per week, runs by status, approved article sources, and where decisions were made.

Refresh Metrics Button

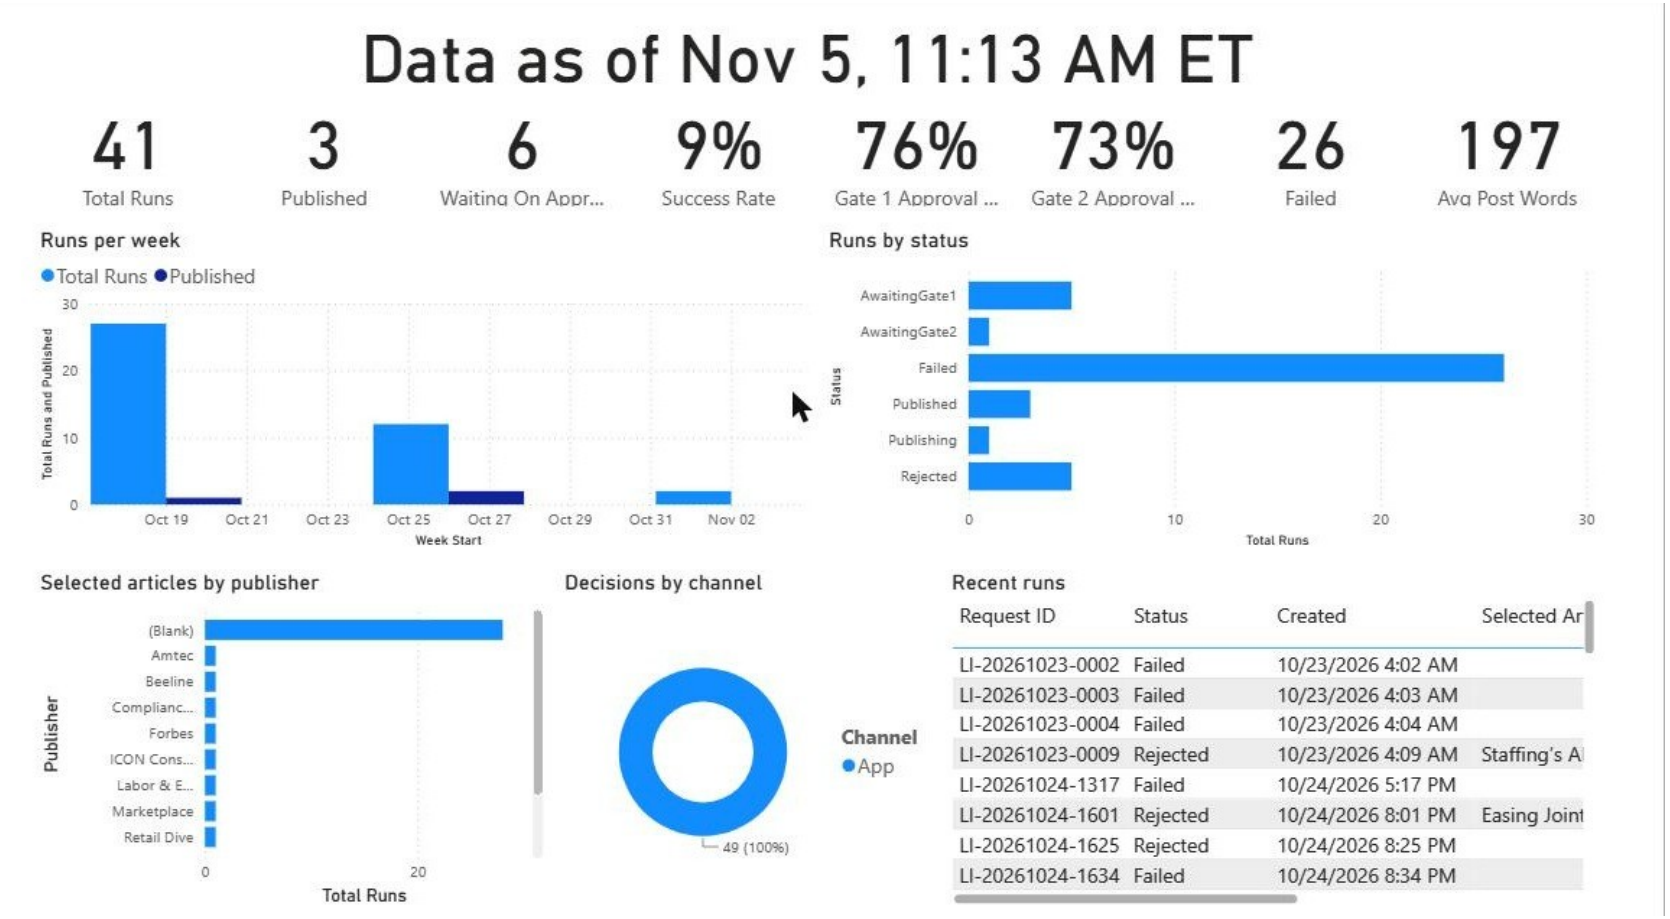

Click Refresh metrics to reload the tiles. It also asks Power BI to refresh, and a green banner confirms the report updates in a few minutes.

Daily Power BI Refresh

The full LinkedIn Content Metrics report also refreshes automatically every day at 6 AM Eastern.

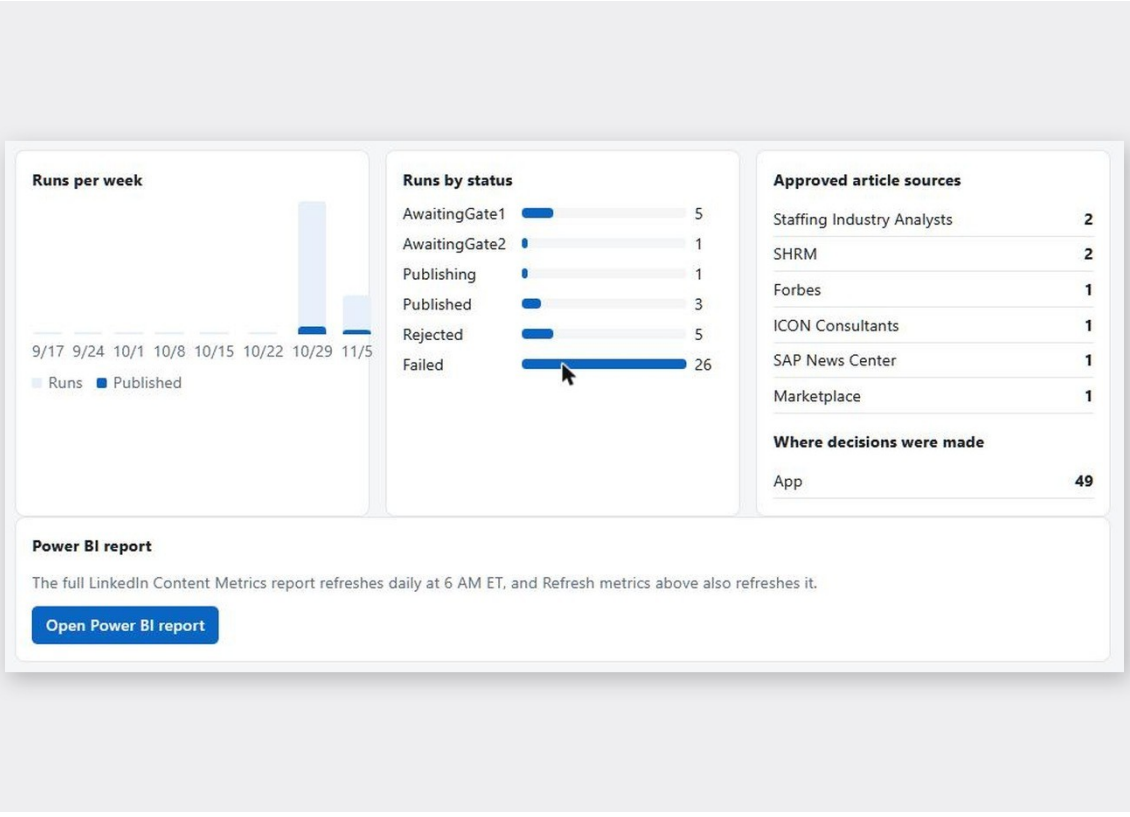

The LinkedIn Content Metrics Report in Power BI

The metrics page shows the Data as of time, eight KPIs, runs per week, runs by status, selected articles by publisher, decisions by channel, and recent runs. Hover over any visual for details, or open Filters on the right.

Refreshing the Metrics

Automatic Daily Refresh

Power BI refreshes the report every day at 6 AM Eastern from the SharePoint run lists. Check “Data as of” at the top of the report.

Refresh on Demand

On the Dashboard tab, click Refresh metrics. The tiles update at once and Power BI starts a refresh of the full report.

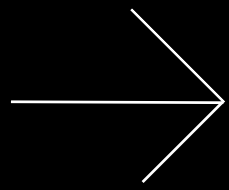

Allow a Few Minutes

The green banner says Power BI refresh requested. Reload the report a few minutes later to see the new numbers.

Open the Full Report

Click Open Power BI report at the bottom of the Dashboard tab. The report opens in a new browser tab.

Alerts and Troubleshooting

Understanding Failure Alerts

When Alerts Fire

Zero valid articles, articles that break recency or required-field rules, a publishing error, or a run that hits the send-back limit.

What the Alert Shows

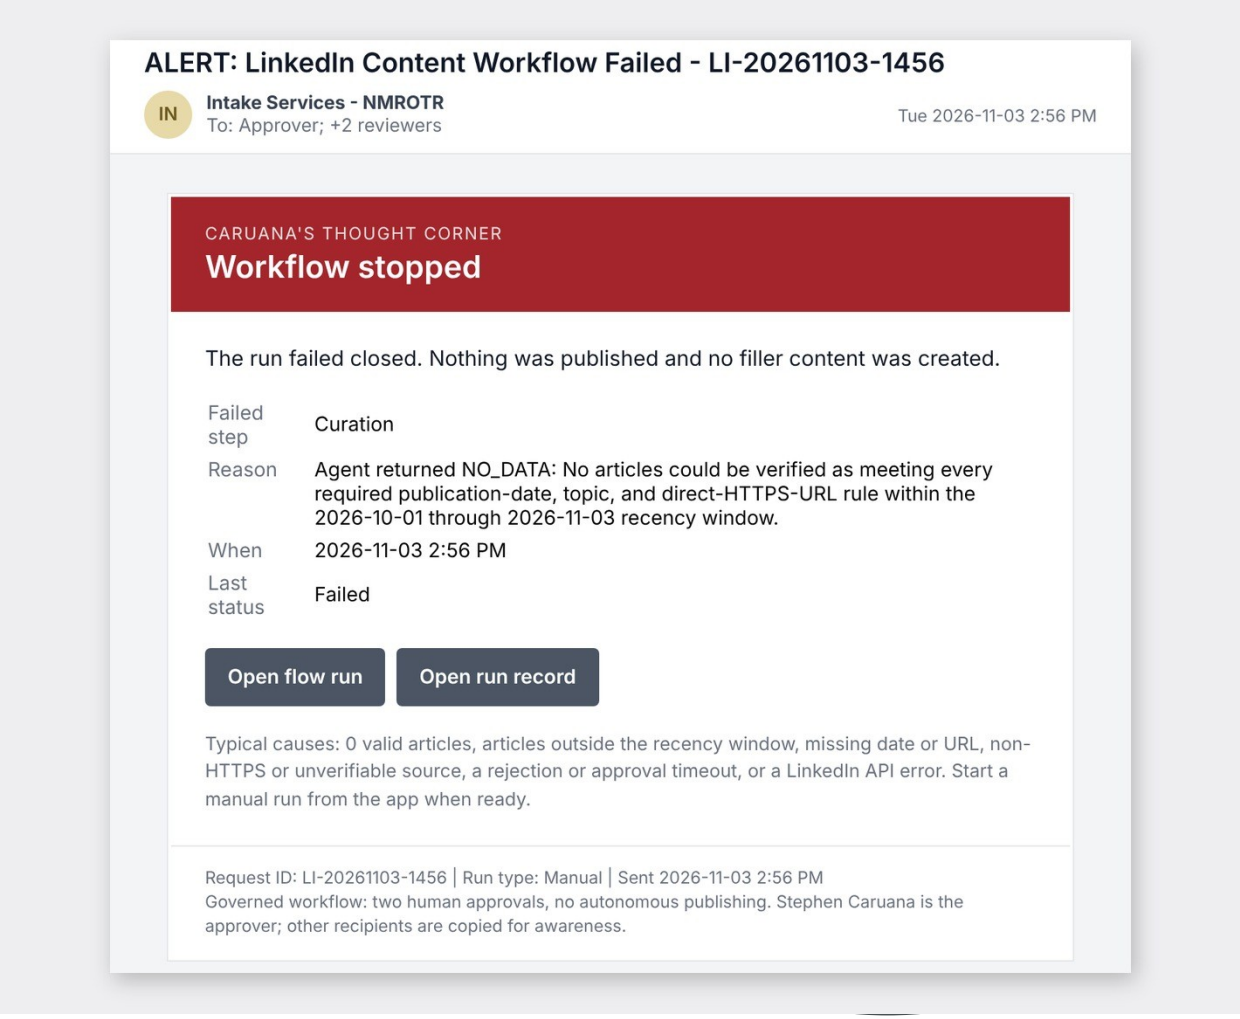

Subject “ALERT: LinkedIn Content Workflow Failed,” with the failed step, reason, time, last status, and Open flow run and Open run record buttons.

What Happens to the Run

The run stops and its status changes to Failed. Nothing is published, and no filler content is ever substituted.

Your Next Step

Read the alert, then start a new run with adjusted parameters, or forward it to the administrator if the cause is unclear.

Troubleshooting Common Situations

Situation	Likely cause	What to do
No Gate 1 after starting a run	Agent still curating, or the run failed	Wait a few minutes, then check the run status and your alerts
Alert: 0 valid articles	Nothing met the recency or source rules	Broaden the topic or publisher and start a new run
Start a Run menus are blank	Cached app copy, or data access not allowed	Close and reopen the app; click Allow when prompted
“Comments are required”	Send back or Request edits without comments	Add comments and submit the decision again
Same notification more than once	Copies across channels, or a duplicate trigger	Act once; report repeats with the Request ID
Post not on LinkedIn after approval	Publish error, or wrong LinkedIn account connected	Check for a Failed alert; ask the admin to confirm the scaruana22 connection
Dashboard numbers look old	Waiting for the 6 AM Eastern refresh	Click Refresh metrics, wait a few minutes, then reload the report

Best Practices and Getting Help

Decide in One Channel

App, Teams, email, and chat all reach the same run. Pick one, and ignore the copies once your decision is recorded.

Write Useful Comments

Specific send-back and edit comments, such as “more on buyer risk,” give noticeably better results on the next pass.

Treat Gate 2 as Final

Approving publishes live and publicly. Read the full text, check the source link and both footers, then approve.

Getting Help

Contact the workflow administrator with the Request ID, the run status, and any alert you received.
